

Magnum

Fodder Beet

SPECIAL ATTRIBUTES

- Bred for lifting and storing
- 20% DM bulb
- High yields
- Uniform height
- Quality seed

Magnum has been bred specifically for those who mechanically lift and store beet for feeding to animals at a later date.

Magnum has a high dry matter percentage in the bulb, to reduce damage at harvest, minimise transport costs, and prolong storage life. The bulb height and size is more consistent than normal beets, allowing for less damage and wastage at harvest. The very high yields of Magnum minimise harvest costs.

Magnum is a hybrid mono-germ cultivar with high quality seed.
