Granstar® can be grazed after three days

Many farmers are now appreciating the benefits of using DuPont™ Granstar® herbicide when spraying out with glyphosate.

The result is a cleaner job due to a much wider spectrum of weeds being controlled for an extended period. Granstar® added to the glyphosate mix at 40 g/ha will control Clover, Yarrow, Thistles, Ragwort, Sorrel, Chickweed, Spurrey, Wild turnip, Redroot, Shepherd's purse, Fathen, Scarlet Pimpernel, Twin cress, Wireweed and more.

It is important to note that Granstar® does not delay post-application grazing unduly. **Sprayed-out pasture can be grazed from three days** after spraying without impacting on the effectiveness of the investment.

There is a 14-day withholding period before sowing, and 7-day withholding period before cultivating.

Always read and follow label directions.

Silage time – an opportunity for Dock control

After silage comes off it's a great time to get those Docks out of the paddock with DuPont™ Harmony® herbicide.

Wait 7–14 days after the silage has gone, allowing the Docks to throw out fresh leaf, then spray at 30 grams per hectare; the paddock will be growing grass dry matter rapidly at this point.

For Best Results

- Make sure that the pasture is not under stress from cold or dry (or impending drought) conditions.
- Apply Harmony® during Spring flush or under rainfall or irrigation.
- After grazing allow pasture to freshen up for 1–2 weeks before application.
- Ensure there is sufficient leaf area to allow uptake of the herbicide.

Always read and follow label directions.
